LSST Data Management Acceptance Test Specification

1 Introduction

This document is intended to specify the acceptance test procedures for the LSST Data Management System. It is a work in progress; the current version provides Test Cases covering ~ 35% of the requirements. It does not yet provide full Test Plans for comprehensive testing nor identify the fraction of each requirement covered by the existing Test Cases.

This document will be updated as work continues on completing Test Cases, Test Plans, and requirements coverage.

1.1 Objectives

This document describes the test cases required to validate the Data Management System requirements described in the LSST DM Subsystem Requirements document LSE-61. It identifies test cases and procedures for the tests as well as the pass/fail criteria for each test.

A full description of the LSST Data Management System is provided in the Data Management System Design document, LDM-148 with the science requirements detailed in the LSST Science Requirements Document LPM-17.

1.2 Scope

This document provides the acceptance test plan for the whole Data Management System (DMS), as described by the Data Management System Requirements in LSE-61.

2 Approach

This document describes the acceptance tests for the integrated Data Management System, with a focus on whether the data products and functionality provided satisfy the requirements described in LSE-61.

The requirements from LSE-61 are extracted into the Jira "LSST Verification and Validation" Project, managed through the Jira Test Management Plugin system. Each LSE-61 requirement leads to a "LSST Verification and Validation" (LVV) Element. Each LVV Element comprises one or more more Test Cases. Each Test Case describes a Test Script to be executed, the coverage, pre-conditions, configuration, test results, and other details as specified by LDM-503. Test Scripts may have common set up and analysis steps. The Jira system allows for these steps to be shared by other Test Scripts. This improves clarity and consistency across all Test Cases.

In this document, each Test Case is listed here with the LVV Element it tests, a summary of the Test Items exercised by the Test Case, and the detailed steps to be executed by the Test Case. Shared steps between Test Scripts have been explicitly written out to appear fully in each Test Case.

2.1 Features to be tested

All top-level requirements for the LSST Data Management System described in LSE-61 are to be tested, including

- Data Products
- Alert, Calibration and Data Release Production
- LSST science pipeline software and middleware
- LSST facilities including the data archive, base, summit, and the communications between them to accept science and engineering data

2.2 Features not to be tested

This document does not describe facilities for periodically generating or collecting key performance metrics (KPMs), except insofar as those KPMs are incidentally measured as part of executing the documented test cases.

2.3 Pass/fail criteria

The results of all tests will be assessed using the criteria described in LDM-503 §4.

Note that when executing pipelines, tasks, or individual algorithms, any unexplained or unexpected errors or warnings appearing in the associated log or on screen output must be described in the documentation for the system under test. Any warning or error for which this is not the case must be filed as a software problem report and filed with the DMCCB.

2.4 Suspension criteria and resumption requirements

Refer to individual test cases where applicable.

2.5 Naming convention

LVV : Is the label for the “LSST Verification and Validation” project in Jira.

LVV-XXX : Are Verification Elements, where XXX is the Verification Element identifier. Each Verification Element has at least one Test Case.

LVV-TYYY : Are Test Cases. Each Test Case is associated with a Verification Element, where YYY is the Test Case identifier.

The Verification Elements are drawn from LSE-61 requirements which have names of the form DMS-REQ-ZZZZ.

	Expected Result	
3	Description	Select a single visit from the dataset, and extract its WCS object, calexp image, psf model, and source list.
	Test Data	No data.

Step	Description, Input Data and Expected Result	
	Expected Result	
4	Description	Inspect the calexp image to ensure that <ul style="list-style-type: none"> 1. A well-formed image is present, 2. The variance plane is present and well-behaved, 3. Mask planes are present and contain information about defects.
	Test Data	No data.
	Expected Result	An astronomical image with mask and variance planes. This can be readily visualized using Firefly, which displays mask planes by default.

2-1 from LVV-T901	Description	Perform the steps of Moving Object Pipeline (MOPS) processing on newly detected DIASources, and generate Solar System data products including Solar System objects with associated Keplerian orbits, errors, and detected DIASources. Open LVV-T63 in Jira

4.41.1 Verification Elements

- LVV-45 - DMS-REQ-0103-V-01: Produce Images for EPO

4.41.2 Test Items

This test will verify that the DRP pipelines produce the image data products called out in LSE-131. Currently this is limited to a color all-sky HiPS map. This will be verified (1) by inspection of pipeline configurations and (2) in operations rehearsals on precursor data. The production of a usable HiPS map will be verified by browsing it with community tools.

4.41.4.1 Software

4.41.4.2 Hardware

4.41.5 Input Specification

In order for an operational test to be successful, as a precondition the inputs to that production must exist. For the only currently mandated image data production in LSE-131, a color all-sky HiPS map down to 1 arcsecond resolution, the prerequisite inputs to that are the single-filter coadds in the bands required by the yet-to-be-specified color prescription.

Open LVV-T131 in Jira

4.108.1 Verification Elements

- LVV-63 - DMS-REQ-0160-V-01: Provide User Interface Services

4.108.2 Test Items

Verify the availability and functionality of the broad range of user interface services called for in the requirement, as applied to both Nightly and DRP data. This will primarily be done by verifications performed at the LSST Science Platform level, based on the requirements in LDM-554; however, a high-level set of tests corresponding to the DMS-REQ-0160 requirement are defined below.

4.108.3 Predecessors

4.108.4 Environment Needs

4.108.4.1 Software

4.108.4.2 Hardware As noted in Verification Configuration, the systems required to carry out the tests include both an “inside” test execution platform - the ability to execute test notebooks within the Science Platform Notebook Aspect - and an “outside” test execution platform with connectivity to the Science Platform instance under test that is comparable to that available to offsite science users.

4.108.5 Input Specification

1. Testing this requirement relies on a set of data products meeting the data model implied by the DPDD existing in a deployment of the Science Platform and its underlying database and file services.
 - (a) In particular, both image and catalog data products are required.
 - (b) From the specific language of the underlying requirement, it appears clear that coadded data products are required, but in practice single-epoch data products should be included in the test as well.
2. Depending on when this requirement is tested, the tests may involve either or both of precursor data and LSST commissioning data. The use of the latter is ultimately essential to ensure that the tests are performed with as LSST-like a dataset as possible.

4.108.6 Output Specification

4.108.7 Test Procedure

Step	Description, Input Data and Expected Result	
1	Description	<p>Establishment of test coordinates:</p> <p>Establish sky positions and surrounding regions (e.g., cones or polygons), field sizes, filter bands, and temporal epochs for the tests that are consistent with the known content of the test dataset, whether precursor or LSST commissioning data.</p> <p>Establishing sky positions should include pre-determining the corresponding LSST “tract and patch” identifiers.</p> <p>If the plan to not keep all calibrated single-epoch images on disk is still in place at the time of the test, identify for use in the test both images that are, and are not, on disk.</p> <p>Establish target image boundaries, projections, and pixel scales to be used for resampling tests. Ensure that at least some of these test conditions include coadded image boundaries that cross tract and patch boundaries, and single-epoch image boundaries that cross focal plane raft boundaries.</p>
	Test Data	No data.
	Expected Result	
2	Description	<p>Butler image access:</p> <p>From within the Notebook Aspect, verify that coadded images for the identified regions of sky and filter bands are accessible via the Butler. Verify that the same images are available whether obtained by direct reference to the previous established tract/patch identifiers or by the use of LSST stack code for retrieving images based on sky coordinates.</p> <p>From within the Notebook Aspect, verify that single-epoch raw images for the selected locations and times are available. Verify that calibrated images (PVI) for the selected locations and times are available; depending on the details of the test dataset, verify that PVI still on disk can be retrieved immediately.</p> <p>Verify that lists or tables of image metadata, not just individual images, can be retrieved. E.g., a list of all the single-epoch images covering a selected sky location.</p>
	Test Data	No data.
	Expected Result	

Step	Description, Input Data and Expected Result	
3	Description	Programmatic PVI re-creation:
		From within the Notebook Aspect, verify that the recreation on demand of a PVI can be performed. Ideally, this should be done as follows:
		<ul style="list-style-type: none"> • Verify that recreation of a PVI that <i>is</i> still available works and that it reproduces the original PVI exactly (except for provenance metadata that must be different) or within the reasonable ability of processing systems to do so (e.g., taking into account that the original calibration and the recreation may have run on different CPU architectures). • The test conditions should ensure the verification that a recreation was actually performed, i.e., that the still-available PVI was not returned instead. • Note that it does not appear to be a requirement that <i>at Butler level</i> recreation on demand of PVIs is a completely transparent process. If this <i>is</i> decided to be a requirement, the test must also verify that it has been satisfied. If it is <i>not</i> a requirement, verify that adequate documentation on the PVI-recreation process (e.g., the SuperTasks and configuration to be used) is available.
	Test Data	No data.
	Expected Result	
4	Description	Butler catalog access:
		From within the Notebook Aspect, verify that all the catalog data products described in the DPDD can be retrieved for the coordinates selected above via the Butler. (This test should include access to SObject data, but the details of how such a test would depend on the coordinate selections require additional thought.)
	Test Data	No data.
	Expected Result	
5	Description	LSST-stack-based resampling/reprojection:
		Verify the availability of software in the LSST stack, and associated documentation, that permits the resampling of LSST images to different pixel grids and projections. Exercise this capability for the test conditions selected in Step 1 above. Perform photometric and astrometric tests on the resulting resampled images to provide evidence that the transformations performed were correct to the accuracy supported by the data.
	Test Data	No data.
	Expected Result	

Step	Description, Input Data and Expected Result
6	Description Comment: The following API Aspect test steps should be carried out on the required “offsite-like” test platform, to ensure that their success does not reflect any privileged access given to processes inside the Data Access Center or other Science Platform instance. However, at least a small sampling of them should <i>also</i> be carried out <i>within</i> the Science Platform environment, i.e., in the Notebook Aspect, and the results compared.
	Test Data No data.
	Expected Result
7	Description API Aspect image access: Using IVOA services such as the Registry and ObsTAP, from the “offsite-like” test platform, verify that the existence of the classes of image data products foreseen in the DPDD can be determined. Verify that ObsTAP and/or SIAV2 can be used to find the same images and lists of images for the established test coordinates that were retrieved via the Butler in Step 2 above. Verify that the selected images are retrievable from the Web services. Verify that the retrieved images are identical in their pixel content and metadata. The tests must include both coadded and single-epoch images.
	Test Data No data.
	Expected Result
8	Description API Aspect image transformations: Verify that image cutouts and resamplings can be performed via the IVOA SODA service, and that the results are identical to those obtained for the same parameters from the LSST-stack-based tests in Step 5. (The requirements for supported reprojections, if any, in the SODA service have not been established at the time of writing.)
	Test Data No data.
	Expected Result
9	Description API Aspect catalog data access: Verify that the IVOA Registry, RegTAP, TAP_SCHEMA, and other relevant mechanisms can be used to discover the existence of all the catalog data products foreseen in the DPDD. Using the IVOA TAP service, verify that all the catalog data products foreseen in the DPDD can be retrieved for the coordinates determined in Step 1. Verify that their scientific content is the same as when they are retrieved via the Butler.
	Test Data No data.

10	Description Comment: The Portal Aspect tests below should be carried out from a web browser on an “offsite-like” test platform, to ensure that no privileged access provided to intra-data-center clients is relied upon.

(Involves: LSP Portal, MOPS and Forced Photometry)

4.134.3 Predecessors

4.134.4 Environment Needs

4.134.4.1 Software

4.134.4.2 Hardware

4.134.5 Input Specification

1. DECam HiTS data could be an appropriate set for this activity.
2. Precovery pipelines for follow-on to alert processing must exist and be made available as a containerized version within the Science Platform.
3. Determine limitations over which general precovery is supported. I would suggest that precovery services be limited to current (or last two) DRP campaigns with the possible addition of including non-DRP products to encompass observations over the preceding year (does this then require means to re-generate PVLs from Alert Production in addition to DRP?)
4. Could re-use elements of LVV-T80 where quasars are used to test faint object detection.

	Expected Result	
3	Description	Examine the results. Compare the results for the period where there is overlap with precovery run... and quasar photometry with those from LVV-T80 to verify user service performs as production services.

In matters of cost, system reliability (functioning properly at a given time) has precedence over system availability (ability to use the system at a given time). The optimization may be outside the realm of direct testing as it is more of a system provisioning guideline but on its face it demands that the Data Management System include failure reporting, regimented change control, acceptance testing, maintenance and monitoring.

4.154.2 Test Items

This applies only to downtime that would prevent the collection of survey data. Verification means that analysis has occurred to identify likely hardware failures that would prevent survey operations and that mitigations that minimize the downtime to less than DM Downtime (1 day/year) are in place. Known systems that fall in this category include: Image and EFD Archiving, Observatory Operations Data, Telemetry Gateway, Data Backbone, Managed Database, Inter-Site Networks, and Service Management and Monitoring.

4.158.1 Verification Elements

- LVV-75 - DMS-REQ-0173-V-01: Summit to Base Network Reliability

4.158.2 Test Items

This approach is necessitated by not wanting to actually cut the fiber just for test purposes:

- Pick a point on the network (Time Domain graph) and simulate a fault (e.g. disconnect

a cable).

- Detect there a fault.
- Diagnose that it is a break.
- Measure the cable with the OTDR to locate the distance from the end point.
- Elapse time to simulate the following:
 - Go to the most inaccessible place which would mean carrying all the tools/splicer/-generator/tent equipment some metres.
 - Erect a tent to make the splice
 - Start the generator
 - Do a splice on some random piece of cable
 - At an end point measure the cable again to ensure it is break free.
 - Take down and reinstall an isolate pole (not in the actual fiber path)
 - Put the cable on the pole.
- Restore connection (e.g. reconnect cable)
- Measure with OTDR to ensure back to normal state.

5 Reusable Test Cases

Test cases in this section are made up of commonly encountered steps that have been factored out into modular, reusable scripts. These test cases are meant solely for the building of actual tests used for verification, to be inserted in test scripts via the “Call to Test” functionality in Jira/ATM. They streamline the process of writing test scripts by providing pre-designed steps, while also ensuring homogeneity throughout the test suite. These reusable modules are not themselves verifying requirements. Also, these test cases shall not call other reusable test cases in their script.
